

Job description - Devops Engineer

We are looking for a Devop profile to manage software development cycles with continuous integration, feature oriented testing automatization and finally product deployment, monitoring and second line support.

Package:

Startup salary and benefit package plus:

- Develop products serving a great humanist purpose
- Be part of a world class technical team
- Use cutting edge technologies (computer vision, deep learning, depth sensing, IoT, containerization)
- Flexible work schedule
- Have a real impact on the company strategy and development
- Be part of an international venture supported by successful entrepreneurs
- Stock option plan for truly skilled and motivated team member

Your job:

- You will participate to global product evolution as a development team member
- You will be responsible for release management and testing
- You will be responsible for software deployment at the end-user site, including data and network security
- You will be responsible for monitoring production environment and developing/integrating your tools to facilitate the process
- You will be part of the second line support

Your skills:

- docker / docker-compose
- Jenkins pipelines
- Good knowledge of Linux / scripting (bash, python)
- git and git flow
- Security management (certificate signing, revoking, TLS, letsencrypt)
- C/C++ and nodejs knowledge is a plus

Your profile:

- You're a team player
- You're creative and solution oriented
- You love quality, not over engineered solutions
- You're passionate and hungry about new software technologies
- You're tech agnostic
- You're young or old, experienced or not
- You have a pet project which has nothing to do with your job
